

Subj 1 25. (Amended) An electro-optical device comprising:
a first substrate;
an active matrix circuit having a plurality of pixels arranged in a matrix form on said first substrate;
at least one driver circuit for driving said active matrix circuit on said first substrate, each of said active matrix circuit and said driver circuit comprising thin film transistors provided on said first substrate;
a second substrate opposed to said first substrate;
a liquid crystal provided between said first substrate and said second substrate; [and]
a sealing member provided between said first substrate and said second substrate for sealing said liquid crystal therebetween, said sealing member enclosing said active matrix circuit and said driver circuit,
[wherein said second substrate has at least one side edge which is substantially aligned with a side edge of said first substrate]
an inlet for injecting said liquid crystal between said first substrate and said second substrate,
wherein said inlet is provided to said sealing member and on a side of said first substrate and said second substrate, and
wherein said first substrate and said second substrate are substantially aligned with each other at least at said side.

Subj 2 30. (Amended) An electro-optical device comprising:
a first substrate;
an active matrix circuit having a plurality of pixels arranged in a matrix form on said first substrate;

at least one driver circuit for driving said active matrix circuit on said first substrate, each of said active matrix circuit and said driver circuit comprising thin film transistors provided on said first substrate;

a second substrate opposed to said first substrate;

a liquid crystal provided between said first substrate and said second substrate; and

a sealing member provided between said first substrate and said second substrate for sealing said liquid crystal therebetween, said sealing member enclosing said active matrix circuit and said driver circuit,

an inlet for injecting said liquid crystal between said first substrate and said second substrate,

wherein said inlet is provided to said sealing member and on a side of said first substrate and said second substrate,

wherein said first substrate and said second substrate are substantially aligned with each other at least at said side, and

[wherein said second substrate has at least one side edge which is substantially aligned with a side edge of said first substrate, and]

wherein an outer edge of said sealing member is located inside side edges of said first and second substrates.

EB Feb 27 35. (Amended) An electro-optical device comprising:
a first substrate;
an active matrix circuit having a plurality of pixels arranged in a matrix form on said first substrate;
at least one driver circuit for driving said active matrix circuit on said first substrate, each of said active matrix circuit and said driver circuit comprising thin film transistors provided on said first substrate;

a second substrate opposed to said first substrate;
a liquid crystal provided between said first substrate and said second substrate;

a sealing member provided between said first substrate and said second substrate for sealing said liquid crystal therebetween, said sealing member enclosing said active matrix circuit and said driver circuit[,]; and

an inlet for injecting said liquid crystal between said first substrate and said second substrate,

wherein said inlet is provided to said sealing member and on a side of said first substrate and said second substrate,

wherein said first substrate and said second substrate are substantially aligned with each other at least at said side, and

wherein said second substrate has at least one side edge which is substantially aligned with a side edge of said first substrate and an outer edge of said sealing member.

Subj > 40.
(Amended) An electro-optical device comprising:
a first substrate;
an active matrix circuit having a plurality of pixels arranged in a matrix form on said first substrate;
at least one driver circuit for driving said active matrix circuit on said first substrate, each of said active matrix circuit and said driver circuit comprising thin film transistors provided on said first substrate;
a second substrate opposed to said first substrate;
a liquid crystal provided between said first substrate and said second substrate;

a resin material provided between said first and second substrates, said resin material contacting with said second substrate and covering said driver circuit; [and]

a sealing member provided between said first substrate and said second substrate and enclosing said active matrix [elements] circuits and said driver circuit; and

an inlet for injecting said liquid crystal between said first substrate and said second substrate,

wherein said inlet is provided to said sealing member and on a side of said first substrate and said second substrate, and

wherein said first substrate and said second substrate are substantially aligned with each other at least at said side.

41. (Amended) An electro-optical device comprising:

a first substrate;

an active matrix circuit having a plurality of pixels arranged in a matrix form on said first substrate;

at least one driver circuit for driving said active matrix circuit on said first substrate, each of said active matrix circuit and said driver circuit comprising thin film transistors provided on said first substrate;

a second substrate opposed to said first substrate;

a liquid crystal provided between said first substrate and said second substrate;

a resin material provided between said first and second substrates, said resin material contacting with said second substrate and covering said driver circuit; [and]

*E4
Cont*

a sealing member provided between said first substrate and said second substrate and enclosing said driver circuit; and

an inlet for injecting said liquid crystal between said first substrate and said second substrate,

wherein said inlet is provided to said sealing member and on a side of said first substrate and said second substrate, and

wherein said first substrate and said second substrate are substantially aligned with each other at least at said side.

42. (Amended) An electro-optical device comprising:

a first substrate;

an active matrix circuit having a plurality of pixels arranged in a matrix form on said first substrate;

at least one driver circuit for driving said active matrix circuit on said first substrate, each of said active matrix circuit and said driver circuit comprising thin film transistors provided on said first substrate;

a second substrate opposed to said first substrate;

a liquid crystal provided between said first substrate and said second substrate;

a resin material provided between said first and second substrates, said resin material contacting with said second substrate and covering said driver circuit;

a sealing member provided between said first substrate and said second substrate and enclosing said active matrix [elements] circuit and said driver circuit;

a first inlet provided for introducing [said sealing member and] said liquid crystal between said first substrate and said second substrate; and

a second inlet provided for introducing [said sealing member and] said resin material between said first substrate and said second substrate,

wherein said first inlet is provided to said sealing member and on a side of said first substrate and said substrate, and

wherein said first substrate and said second substrate are substantially aligned with each other at least at said side.

Please add new claims 43 and 44 as follows:

--43. An electro-optical device comprising:

a first substrate;

an active matrix circuit having a plurality of pixels arranged in a matrix form on said first substrate;

at least one driver circuit for driving said active matrix circuit on said first substrate, each of said active matrix circuit and said driver circuit comprising thin film transistors provided on said first substrate;

a second substrate opposed to said first substrate wherein a drive circuit is provided on the second substrate at a region opposed to the driver circuit;

a liquid crystal provided between said first substrate and said second substrate;

a resin material provided between said first and second substrates, said resin material contacting with said second substrate and covering said driver circuit; and

*E51
Cont*

a resin material provided between said first and second substrates, said resin material contacting with said second substrate and covering said driver circuit; and

a sealing member provided between said first substrate and said second substrate and enclosing said driver circuit;

a sealing member provided between said first substrate and said second substrate and enclosing said active matrix elements and said driver circuits.

44. An electro-optical device comprising:

a first substrate;

an active matrix circuit having a plurality of pixels arranged in a matrix form on said first substrate;

at least one driver circuit for driving said active matrix circuit on said first substrate, each of said active matrix circuit and said driver circuit comprising thin film transistors provided on said first substrate;

a second substrate opposed to said first substrate wherein a drive circuit is provided on the second substrate at a region opposed to the driver circuit;

a resin material provided between said first and second substrates, said resin material contacting with said second substrate and covering said driver circuit; and

a sealing member provided between said first substrate and said second substrate and enclosing said driver circuit;

a liquid crystal provided between said first substrate and said second substrate.
